

— DELIVERABLE 1 · CONNECTIVITY VALIDATION

Connectivity Status Report

Validation of connectivity and access across the Skyworks Operational Data Store (ODS) environment, confirming that the systems provided for the subsequent analytical workstreams are connected and in place.

ENVIRONMENT QA · IVNODSSQLQA01	DATABASES IN SCOPE 18
TOTAL DATA VOLUME ~7.2 TB	CONNECTIVITY STATUS All established

1 Purpose

This report documents the outcome of connectivity validation conducted against the Skyworks Operational Data Store (ODS) environment. The objective is to confirm that the systems provided for the subsequent analytical workstreams are connected and in place. All validations were performed against the QA environment (IVNODSSQLQA01).

2 Connectivity Validation Summary

The following access points were validated. All connections were successfully established, with no access failures or blockers identified.

Island Desktop · VPN	Network access layer	✓ Able to connect
IVNODSSQLQA01.ad.skynet	SQL Server database	✓ Able to connect
IVNODSSQLQA02.ad.skynet	SQL Server database	✓ Able to connect
\\IVNODSSQLQA01\SSISDeployed	SSIS package network share	✓ Able to connect
\\IVNODSSQLQA01\FlatFileDataSources	Flat file data sources share	✓ Able to connect

3 Database Landscape

Read access was confirmed across all 18 provided databases. The table below summarizes key metadata studied for each. All databases are online, operating under SQL Server compatibility level 140 (SQL Server 2017), and use the SIMPLE recovery model. The three highlighted databases account for approximately 86% of total data volume.

DATABASE	SIZE (MB)	TABLES	VIEWS	STORED PROCS	SCHEMAS	STATE	COMPAT.	ESTABLISHED
LIB_ECC_RTP	2,657,893	550	990	34	91	Online	140	2024
SAP_Snapshot_AdvPlan	19,500	46	6	8	23	Online	140	2019
SCM	3,850	38	358	63	23	Online	140	2020
SkyAllocate	144	11	0	34	10	Online	140	2020
SkyBuy	19,250	22	15	17	16	Online	140	2023
SkyCentral	95	10	5	4	13	Online	140	2019
SkyCRM	6,350	69	0	391	10	Online	140	2019
SkyEO	1,820	10	2	0	10	Online	140	2019
SkyEOL	60	16	0	0	10	Online	140	2019
SkyExpense	235	23	2	0	10	Online	140	2019
SkyFoundry	200	58	24	174	10	Online	140	2019
SkyProductDocuments	60	2	0	0	10	Online	140	2019
SkyQuote	1,640	68	15	75	10	Online	140	2019
SkySamples	125	14	1	42	10	Online	140	2019
SkySTRMPS	336	39	13	1	11	Online	140	2022
Skyworks_ODS	2,091,850	2,709	2,094	2,637	109	Online	140	2019
Skyworks_ODS_Archive	888,494	571	40	59	38	Online	140	2019
Skyworks_WH	1,480,845	1,041	570	944	83	Online	140	2019
Total	7,189,521	5,297	4,135	4,483	-	-	-	-

Size in MB. Skyworks_ODS (~2.0 TB), LIB_ECC_RTP (~2.6 TB), and Skyworks_WH (~1.4 TB) account for approximately 86% of total data volume.

4 ODS Schema Structure • Skyworks_ODS

Skyworks_ODS is the central hub of the operational data store, containing 109 schemas and 2,709 tables. The schema naming convention reflects the functional domain of the data it holds. The twelve most populated schemas are listed below.

SCHEMA	TABLES
scm	444
dbo	244
sd	224
rr	193
silabs	160
sfdc_old	133
mt	115
sfdc	104
fi	102
mm	100
pp	95
mexfp	86

Top 12 of 109 schemas by table count. The remaining 97 schemas account for 397 tables.

5 SSIS Package Landscape

The SSIS package network share (\\VNODSSQLQA01\SSISDeployed) was accessible, and the package catalog was inspected via SQL Server Agent job step references. Key findings are summarized below.

METRIC	COUNT
Unique .dtsx package files identified	368
SQL Agent job steps executing SSIS packages	926
Unique agent jobs with SSIS steps	454
Primary deployment root	E:\SSIS\Deployed\
Steps referencing local-drive flat file sources	111

The deployment directory is organized by functional domain. Key subdirectories include Skyworks_ODS\rr (240 steps), JDA\FABFP (85 steps), Skyworks_ODS\plm (65 steps), and JDA\SOM (43 steps). A subset of 111 job steps reference flat file data sources, which will require lineage tracing in Deliverable 3.

Three SSIS steps reference packages deployed to the MSDB catalog using the /DTS or /SQL syntax rather than a file path; these will require catalog-level inspection during the metadata ingestion phase.

6 SQL Server Agent • Job Inventory

1,132 SQL Server Agent jobs were identified across the environment. The job inventory was analysed from both the job-history and package-step reference perspectives.

METRIC	COUNT
Total agent jobs	1,132
Active (Is Enabled = 1)	350 (31%)
Inactive (Is Enabled = 0)	782 (69%)
Jobs with SSIS package steps	454
Jobs with CmdExec-only steps	303
Last recorded successful run	340 jobs
Last recorded failed run	47 jobs

The high proportion of inactive jobs (69%) indicates a substantial legacy footprint on the agent. For the purposes of lineage mapping in Deliverable 3, the active job set (350 jobs) will be the primary analytical focus, with inactive jobs examined for historical lineage context where relevant.

7 Observations & Considerations

Data Volume

Total database size across the 18 in-scope databases is approximately 7.2 TB. Three databases, Skyworks_ODS (~2.0 TB), LIB_ECC_RTP (~2.6 TB), and Skyworks_WH (~1.4 TB), account for approximately 86% of total volume.

Flat File Dependencies

111 SSIS job steps reference flat file data sources via a local server path (E:\Project\FlatFileDataSources\). These represent upstream data inputs outside the SQL Server catalog and will need to be inventoried during the lineage mapping phase to ensure end-to-end flow coverage.

SSIS Package Reuse Pattern

Several packages follow a parameterized reuse pattern: the same .dtsx file is invoked by multiple agent jobs with different runtime parameters (for example, plant code, environment, or date range). This is a significant design pattern that will shape how lineage is mapped, as a single package node in the lineage graph may represent multiple logical data flows.

Legacy Job Footprint

69% of agent jobs are currently disabled. While these are not active data flows, they represent historical lineage context. Several jobs are explicitly flagged for deletion in their naming convention.

8 Next Steps

With connectivity to the provided systems validated, the engagement proceeds to the following concurrent workstreams.

- ✓ **Deliverable 2 · ODS Metadata Inventory.** Build the metadata inventory across the in-scope databases.
- ✓ **SSIS package parsing** will be initiated across the identified .dtsx packages.

9 Further Details Requested

To progress the lineage mapping, the following inputs are requested from the Skyworks team.

1 Object-level query logs across the ODS.

Required to identify actively consumed datasets and prioritize them accordingly.

Discussed in sync call on 7/1/2026 · no further action needed

2 Report metadata or report definition files.

Required to assess object usage across the reporting layer for building the data lineage.

Discussed in sync call on 7/1/2026 · no further action needed

3 A consolidated job-to-package-to-flat-file mapping.

We reviewed the SSIS packages residing in the SSISDeployed network folder and attempted to map them to their corresponding SQL Agent jobs by examining the Step Command entries. While a number of packages were successfully identified within the folder, several could not be located in SSISDeployed. Please confirm whether any documentation exists on your end that enumerates all active or currently utilized SQL Agent jobs along with their associated SSIS packages and flat files, mapped against one another.

Discussed in sync call on 7/1/2026 · pending resolution

10 Summary

Connectivity to all provided systems, the QA SQL Server instances, the SSIS package share, and the flat file share, has been validated with no blockers. Read access is confirmed across the 18 in-scope databases, totalling approximately 7.2 TB, and the SSIS and SQL Agent landscapes have been profiled at a catalog level. The engagement now proceeds into the metadata inventory and SSIS parsing workstreams, supported by the inputs requested above.
