

From raw estate to **trusted, AI-ready** data.

Two questions, answered. **Understand the data** you have, and **prove it is good for AI**.

WHAT WE NEED	Your data sources — read-only. Nothing moves.
WHAT WE DO	Mapping, discovery, lineage, security and gap analysis.
HOW WE DO IT	BPC , the assessment engine, + human judgment.

THE PROBLEM

Data is scattered across ERP, databases, warehouses and legacy pipelines.
No one can say what exists, what it is worth, or whether to trust it.

WHY IT MATTERS

AI and analytics are only as good as the data behind them.
You need a clear read on the estate before you invest, with risk known from day one.

THE ENGINE

The system generates 80% of the telemetry automatically.
People supply the 20% of context that carries the decision.

Human in the loop. Effort rises with the stakes — 5% setup, 30% context, 50% at the sign-off where trust is decided.

Governed end to end · quality, lineage, security and compliance across every phase.

OUTCOMES

Full visibility A complete map of the estate in days, not months.	Spend where it counts Retire dead weight, invest in what drives value.	Risk under control PII and compliance exposure surfaced and governed.	Ready for AI A certified baseline teams and models can build on.
