

BPC for Data — how to use it

BPC for Data is the console that connects the data estate an assessment runs on, catalogs and enriches it, maps lineage end to end, and hands over the findings. This guide walks the flow and calls out **what each page shows you**, section by section.

1 SIGN IN

Pick a profile	On the first screen choose Start Fresh Project to begin a new, blank assessment, a Client project, or the Mock Client (a fully populated example you can explore).
PIN to open	Saved client and mock projects are gated — enter 2345 to open. Start Fresh opens with no PIN.
Pick a role	Each role card shows a one-line description of the person. What you can open depends on the role (next section).

2 ROLES — WHO SEES WHAT

C-Level	Overview only. The executive read on progress and outcomes.	Solution Architect	Overview, Infrastructure, Unification, Presentation.
Data Engineer	Overview, Infrastructure, Collection, Unification.	Data Analyst	Overview, Collection, Unification, Presentation.
Delivery / PM	Overview and every assessment layer. No Admin Settings.	Admin	Everything, plus Admin Settings and project setup.

Pages are trimmed per role. A locked or hidden layer means that role does not work on it — the sidebar only lists what is relevant to you.

3 OVERVIEW — THE FACE OF THE STUDY

The landing page for every profile, written for a C-suite audience. No setup needed to read it.

WHAT YOU'LL SEE HERE

- **Headline & engagement** — the background, the outcome, and who owns the deliverables.
- **Highlight metrics** — the top numbers for the estate (volume, databases, tables, packages).
- **Deliverables / Active weeks / Phases** — a blank Start Fresh shows — until the project is scheduled; a real project shows counts.
- **Assessment progress** — a % toward target with milestones (delivered / in-progress / planned).
- **Delivery timeline** — weeks × deliverables with phase bands and status-colored bars, with **Open** links on delivered items.
- **Deliverables grid** — every output with its status and an Open button when delivered.

4 SET UP SOURCES WITH THE FS DATA GENIE

On a Start Fresh project the Genie opens automatically and glows with a [Start here](#) pill — this is where every new project begins.

Walk the groups The Genie asks one source group at a time in **I → C → U** order. Tick the sources in scope (ERP, CRM, databases, cloud, models) and continue.

Finish On finish, your picks are provisioned as connections. Only the sources you chose appear under Infrastructure.

Already set up? If a project's sources are already gathered, the Genie says **Info gathered** and doesn't ask again — it points you to Infrastructure to review endpoints.

5 ASSESSMENT LAYERS

The work is organized into four layers. Each layer has sub-parts with live mocked metrics, and a **Presentation** block showing its deliverables and status. Non-Infrastructure layers stay **Locked** until every selected source is connected.

I Infrastructure

CONNECTIVITY

WHAT YOU'LL SEE HERE

- **All connections split into Sources / Cloud / LLM**, each with an **X / Y connected** callout.
- **Usage meters** — records ingested, freshness, compute, storage, LLM tokens, inference calls. **Meters only appear once a category has a connected source** — nothing is faked before you connect.
- **Per-source cards** — open one to see the prefilled endpoint, auth mode, and a **secret reference** (vault path / key name), never a raw password. Hit **Test connection** for a green result with ping time and discovered objects.

C Collection

DISCOVERY

WHAT YOU'LL SEE HERE

- **Domain Intelligence** — business domains and data ownership captured with SMEs.
- **Automated Data Catalog** — tables, schemas, columns and sizes ingested automatically.
- **Data Enrichment** — usage patterns, access tools and frequency from query-log analysis.
- **Transformation** — pipeline parsing and ETL / database assessment (role-gated for engineers and analysts).

U Unification

LINEAGE

WHAT YOU'LL SEE HERE

- **End-to-End Visualization** — lineage from upstream sources through transformations to downstream consumption.
- **Manual Additions** — analyst-added lineage where API or metadata access is limited.
- **Ownership Mapping** — dataset ownership and reference-data resolution.

WHAT YOU'LL SEE HERE

- **Classification & Alignment** — Bronze / Silver / Gold classification and the current-state alignment baseline.
- **Impact & Backlog** — cost/performance simulation and the prioritized transition backlog.
- **Enablement** — playbook, walkthroughs and the executive summary. This layer is the face of the study; all deliverables live here.

6 RUN FULL PROJECT — SEE IT END TO END

The fastest way to understand BPC for Data. On a Start Fresh project the **Run full project** button (top bar) populates the entire engagement at once — so you can see how a finished project looks without doing every step by hand.

What it does	Connects every source, then presents the whole engagement as complete: all connections live , usage meters active, every deliverable delivered and openable , alignment at target, all milestones done, and the schedule (active weeks + phases) filled in.
Why use it	It's the demo path — a start-to-finish picture of a real engagement. Use it to walk stakeholders through the flow before any real sources exist.
Reset	Signing out of a Start Fresh session discards the run and the next Start Fresh opens blank again.

Prefer a ready-made example? Open the **Mock Client** profile from the login screen — it's permanently populated end to end, no run needed.

7 SAVE & MANAGE PROJECTS

Save as project	While in Start Fresh, use the Save as project bar to name and store the current session. It becomes a saved client project, carrying over the sources you set up.
Delete a project	On the login screen use the trash icon on a client project and enter PIN 2345 . Start Fresh cannot be deleted.

8 ADMIN SETTINGS

Admin-only. Three ways to stand up a new client project, plus stored-profile management.

WHAT YOU'LL SEE HERE

- **Upload SOW** — drop a Statement of Work PDF; engagement, deliverables and systems are extracted to build the Overview. **No financial figures are ever read or shown.**
- **Enter project details** — a manual form (no SOW or JSON needed): client name, engagement, weeks, narrative, highlight metrics and alignment.
- **Add profile from JSON** — the advanced path: upload a prepared client config.
- **Stored profiles** — every project with its type chip (Start Fresh / Client / Mock Client) and a delete action.

Sign-out safety. Leaving a Start Fresh project with unsaved sources prompts you to save or discard first, so nothing is lost by accident — and the next fresh project always starts clean.
