
DELIVERABLE 2 · ODS METADATA INVENTORY

ODS Metadata Inventory

A complete catalog of the Skyworks ODS estate: every database, table, view, column, and programmable object, profiled to depth. Completed in Phase 1, this inventory becomes the foundation for the Phase 2 lineage map and Bronze / Silver / Gold classification.

ENGAGEMENT**Skyworks ODS Assessment****PHASE****Phase 1 · weeks 1-3****SCOPE****18 databases, full metadata**

— INVENTORY AT A GLANCE

One catalog, profiled to the column

Across all 18 in-scope databases, the inventory captures structural metadata at every level: for each column, its data type and nullability, plus key details where the column carries a key role.

COLUMNS PROFILED

164,543

Each column carries its data type and nullability, the granularity lineage tracing and layer classification require.

DATABASES

18

TABLES

5,471

VIEWS

4,134

PROGRAMMABLE OBJECTS

5,108

PROGRAMMABLE OBJECTS BREAKDOWN

4,697 stored procedures · 388 functions · 23 triggers · the transformation logic that will be parsed for lineage.

DEEPEST CATALOG

Skyworks_ODS alone holds 71,664 columns across 2,773 tables · the central hub anchoring the assessment.

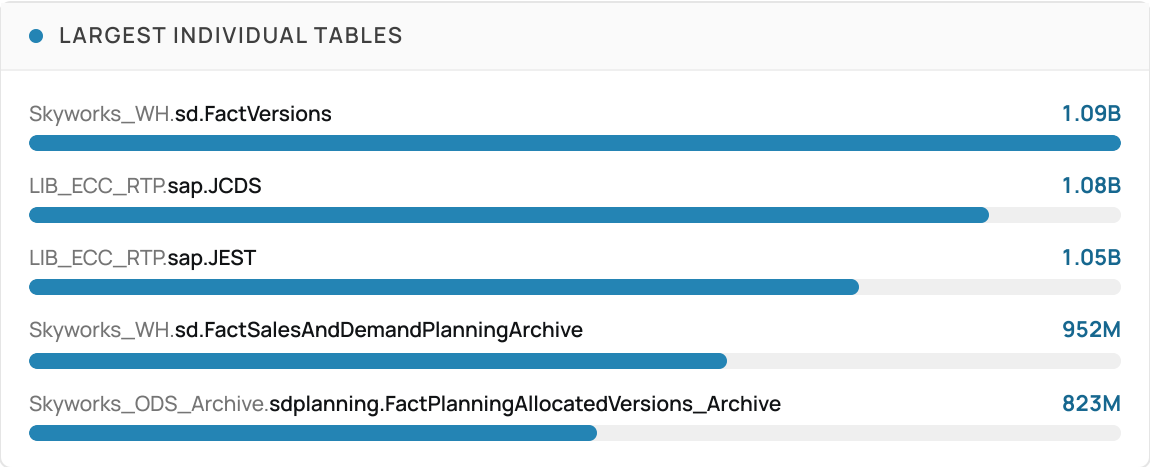

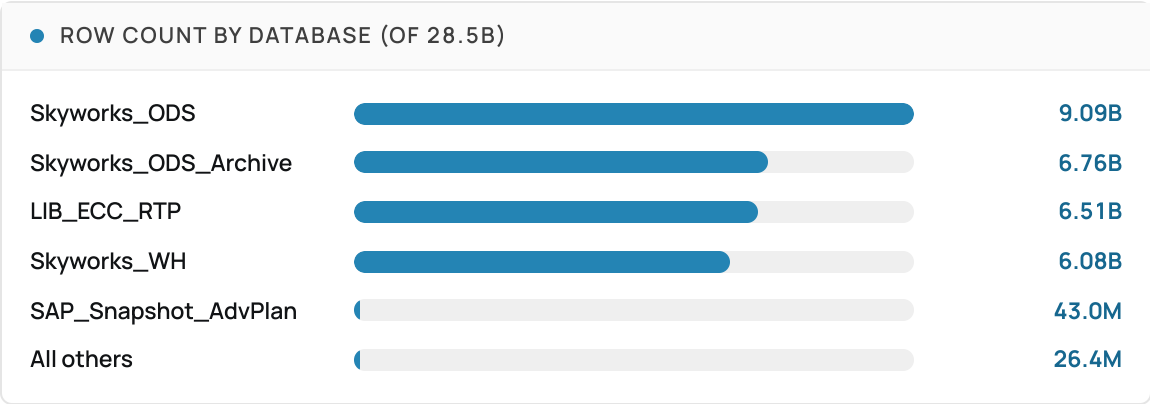

Note Table, view, and object totals are the workbook grand totals; column counts are aggregated across all 18 per-database sheets. The stored-procedure figure combines both catalog buckets (4,693 + 4).

DATA VOLUME LANDSCAPE

28.5 billion rows, concentrated in four estates

Row-count profiling shows volume is heavily concentrated: four databases each hold 6 to 9 billion rows, together over 99% of all rows in the estate. This concentration is where classification and cost-simulation effort will focus.

LONG TAIL

558 tables are empty (0 rows), candidate deprecations to weigh in the transition backlog.

FACT-HEAVY WAREHOUSE

The largest tables are demand-planning and SAP document fact tables · the high-value analytical core.

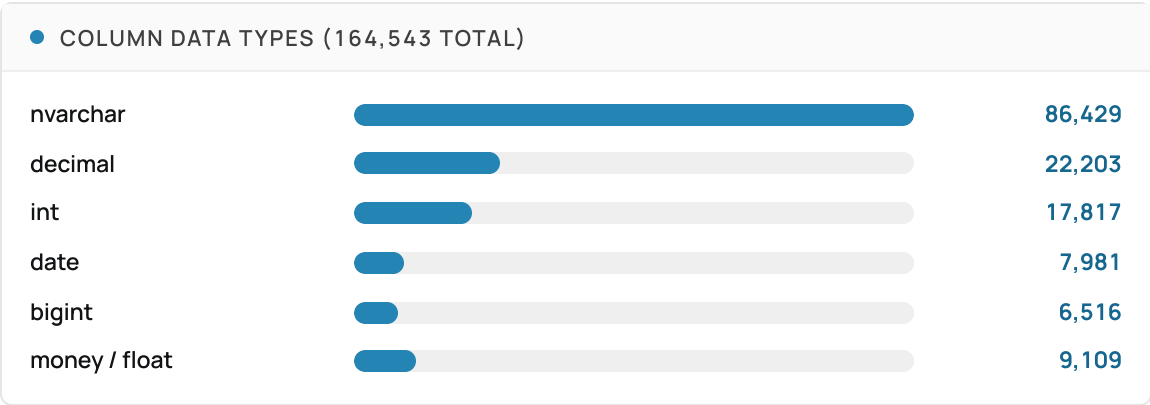

Note Row counts are summed per database across all 5,471 tables; "all others" aggregates the remaining 13 databases, and the concentration share is derived from these totals.

— OBJECT & COLUMN COMPOSITION

What the catalog is made of

Data-type and activity profiling surface both the shape of the data and how much of the estate is actively maintained versus dormant.

78%

NULLABLE

LOOSELY CONSTRAINED

128,696 of 164,543 columns are nullable · a data-quality signal to weigh during classification.

2,217

ACTIVE OBJECTS

MODIFIED 2024 OR LATER

Of 5,108 programmable objects, 2,217 were touched recently; 2,891 are older · a dormant tail for lineage context.

5,206

KEYED COLUMNS

JOIN BACKBONE

Columns carrying key roles define the relationships that drive downstream lineage and join-complexity scoring.

Note Type, nullability, and key counts are tallied across all 164,543 columns; the activity split counts the 5,108 objects by last-modified year. "money / float" combines two types (4,089 + 5,020) and the nullable share is derived.

WHAT THIS ENABLES

The foundation for Phase 2

With the full metadata catalog in place, the engagement moves into lineage mapping and classification. Each downstream deliverable draws directly on this inventory.

D3 ODS Lineage Map

Column-level metadata and the **5,108** inventoried programmable objects feed end-to-end lineage from upstream sources through transformations to consumption.

D4 Dataset Classification

Row counts, key structure, and nullability inform usage scoring to classify every dataset into **Bronze / Silver / Gold** layers.

D5 Architecture Baseline

The volume profile of **28.5 billion** rows anchors the current-state alignment percentage and gap analysis against the target medallion architecture.

DELIVERED

Full inventory delivered as an Excel workbook, 36 sheets spanning summary aggregates, object lists, and per-database column detail.

NEXT

Query-log analysis and SSIS package parsing proceed in parallel to complete the lineage inputs.

—

 DELIVERABLE 2 · COMPLETE

The ODS is fully cataloged

Prepared by Findability Sciences as part of the Skyworks Solutions ODS Assessment engagement. Every database, table, view, column, and programmable object across the 18 in-scope databases is now inventoried to depth. The engagement now proceeds to lineage mapping and dataset classification.
